Overview

RAILPORT® Version 6.1.0 delivers targeted bug fixes and performance-focused enhancements to elevate the efficiency of the scheduler system.

Enhancements

SCHEDULER JOB THROTTLING SYSTEM

- As the number of scheduled reports increased, RP began experiencing "misfires" on the scheduler server. These misfires caused reports to not be triggered. To resolve this issue, we implemented a throttling mechanism to manage scheduler jobs and balance the workload. This system can detect the current workload for a customer's database, predict runtime, and queue jobs in an optimized order to prevent misfires.

Resolutions

EMAIL ADDRESS VALIDATION FIX

- Fixed a bug in the Email Report dialog that prevented users from adding email addresses containing uppercase letters.

ADMIN PANEL NAVIGATION STABILITY

- Addressed a navigation issue where rapid menu clicks in the Admin Panel could lead to incorrect page rendering.

SERVER TIME DISPLAY CORRECTION

- Resolved an issue where the footer incorrectly showed the user's local time instead of the actual server time.
